Shop accounting & bank reconciliation

A complete guide to using the system: entering each shop's daily sheet, recording the payments banked, uploading the statements the banks send, and finding out — every day, without a spreadsheet — which of those payments actually arrived.

1 · What this system is for

Three shops take money all day. Four banks receive it. This system's job is to put those two facts side by side and tell you where they disagree.

Every day, two separate things happen:

- **Each shop writes down what it took and what it banked.** That used to be the paper sheet. Now it is the *daily sheet* in this system.
- **Each bank produces a statement** of what actually landed in the account.

Checking one against the other by hand is slow, and slow means it gets done weekly, or monthly, or not at all. This system does the comparison the moment both sides exist, and sorts every payment into one of three piles:

• Matched	The shop said it banked this, and the bank shows it arriving. Nothing to do.
• Possible	There is a bank line that could be it, but the system will not decide on its own — usually because two lines fit equally well, or the dates differ. A person picks.
• Unmatched	No bank line fits. Either the deposit has not arrived, or something was typed wrongly, or the statement has not been uploaded yet.

Everything else in the system — the dashboard, the reports, the audit log — exists to support that one comparison.

Two rules that never bend

DOLLARS AND CÓRDOBAS ARE NEVER ADDED TOGETHER

You will never see a single combined total anywhere. Every figure is shown twice, once per currency. A payment of \$480 can never be matched to a bank line of C\$480, no matter how close the date. There is no exchange rate anywhere in the system, because a wrong one would be worse than none at all.

NOTHING IS SILENTLY GUESSED OR SILENTLY LOST

If a bank statement has a line the system cannot read, it says so and marks the statement *partially processed* — it does not quietly drop the line. If two bank transactions fit a payment equally well, it offers both rather than picking one. If a bank's statement format is unknown, it refuses the file with an explanation instead of inventing figures.

2 · Who can do what

Everyone signs in as themselves. What they see depends on their role, and a shop user genuinely cannot reach another shop's figures — it is enforced on every request, not just hidden from the menu.

ROLE	CAN DO	CANNOT DO
Administrator	Everything: all shops, all banks, uploads, reconciliation, reports, users, settings.	—
Accountant	All shops and banks; upload statements; reconcile; run and export every report; see the dashboard.	Create users, change roles, change system settings.
Shop user	Enter and edit the daily sheet for <i>their own</i> shop; see their own shop's reconciliation and reports.	See the company dashboard, other shops' figures, bank statements, exports, or any setting.

Roles are not fixed in the software — an administrator can create new ones and tick exactly which permissions they carry (§13.3). The three above are simply what the system is set up with.

RECOMMENDED

Give each shop its own user account and assign only that shop. Do not share one login between people: the audit log records who did what, and a shared account makes that record worthless.

**Reconcilia**
Shop accounting & bank reconciliation

EMAIL

PASSWORD

Sign in

Sessions expire automatically. Every sign-in and financial change is recorded in the audit log.

The sign-in screen. Sessions expire on their own, and both successful and failed sign-ins are recorded.

- 1 Open the address of your system in a browser.
- 2 Type your email address and password.
- 3 Press **Sign in**.

If the password is wrong you will be told only that "email or password is incorrect" — deliberately, so that the form cannot be used to find out which addresses exist.

Changing your password

At the bottom of the sidebar, beside your name, there is a **Password** button.

A dark-themed modal dialog box titled "Change your password" with a close button (X) in the top right corner. It contains three input fields: "CURRENT PASSWORD", "NEW PASSWORD", and "NEW PASSWORD AGAIN". Below the "NEW PASSWORD" field is a hint: "At least 10 characters." At the bottom of the dialog, there is a "Cancel" button and a "Change password" button.

Changing your password signs out every session on every device, including the one you are using. You will be asked to sign in again.

DO THIS FIRST

The password the installer generated for the first administrator was printed on screen and written to a file on the server. Change it, then delete `FIRST-LOGIN.txt` from the server.

4 · Finding your way around

Everything is reached from the sidebar on the left. You will only see the entries your role allows, so a shop user's sidebar is much shorter than an administrator's.

Dashboard	The company-wide overview. Administrators and accountants only.
Daily accounting	The daily sheets. This is where a shop's day is entered.
Bank statements	Upload the PDFs the banks produce, and see what was read out of them.
Transactions	Every line extracted from every statement, searchable.
Reconciliation	Each shop payment beside the bank line it belongs to.
Unmatched	The two exception lists. The most important page in the system.
Reports	Ten reports, exportable to Excel and PDF.
Audit log	Who did what, when, and what changed.
Settings	Shops, banks, users, and how matching behaves.

On a phone the sidebar becomes a menu behind the ☰ button at the top left. See §14.

4.1 Choosing light or dark

The system opens dark. It is easier on the eyes for the long stretches this kind of work involves, and the status colours — green, amber, red — separate more clearly against a dark panel than a white one.

The sun / moon button beside your name at the foot of the sidebar. On a phone it sits in the top bar.

Press it to switch to the light theme, which is better in bright daylight and when you are printing a screen. Your choice is remembered in that browser and survives signing out; it is per-person, so switching does not change what anyone else sees.

Dark — the default

Light

Nothing moves between the two. Every figure, button and column sits in exactly the same place, so instructions in this manual apply to either.

5 · Entering a day's sheet

One sheet per shop, per day. It replaces the paper sheet, and it is where the payments that will later be reconciled are recorded.

DATE	SHOP	STATUS	BALES	SALES USD	SALES C\$	BANKED USD	BANKED C\$	RECONCILIATION
20 Aug 2026	Shop 1	Submitted	20	\$700.00	C\$14,000.00	\$999.00	C\$2,000.00	Matched 1 Unmatched 1 Open
20 Aug 2026	Shop 3	Submitted	55	\$1,640.00	C\$40,200.00	\$830.00	C\$26,493.00	Matched 4 Open
11 Aug 2026	Shop 1	Submitted	42	\$1,310.00	C\$31,840.00	\$660.00	C\$18,550.00	Matched 3 Possible 1 Open
11 Aug 2026	Shop 2	Submitted	31	\$980.00	C\$22,100.00	\$715.00	C\$18,735.00	Matched 3 Open

Daily accounting lists every sheet. The right-hand column shows how that day's payments have reconciled, so you can see at a glance which days still need attention.

5.1 Starting a new sheet

- 1 Open **Daily accounting** from the sidebar.
- 2 Press **New sheet** at the top right.
- 3 Work down the form, section by section — A through F.
- 4 Press **Create sheet** in the bar at the bottom.

The form is laid out in the same order as the paper sheet, so you can copy straight across. Nothing is calculated until you save, except the running totals, which update as you type.

ONE SHEET PER SHOP PER DAY

If a sheet already exists for that shop and date, the system refuses to create a second one and tells you which sheet to open instead. This is deliberate: two sheets for the same day would double-count the takings.

5.2 A · Daily information

A · Daily information

SHOP

Shop 1 — Managua

▼

DATE

09/01/2026

📅

STATUS

Draft — still being entered

▼

Section A. A shop user sees only their own shop in the list.

FIELD	WHAT TO PUT IN IT
Shop	Which shop this day belongs to. Cannot be changed after the sheet is created.
Date	The business day the figures are for — not the day you are typing. Also fixed after creation.
Status	<i>Draft</i> while you are still entering. <i>Submitted</i> when the day is complete. Both are matched against the banks; the status is for people, not the machine.

5.3 B · Sales summary

B · Sales summary

TOTAL SALES (USD)

\$ 1310.00

TOTAL SALES (C\$)

C\$ 31840.00

QUANTITY OF BALES

42

NUMBER OF INVOICES

18

Section B. Sales in each currency are kept apart, as everywhere else in the system.

FIELD	WHAT TO PUT IN IT
Total sales (USD)	Everything sold that day in dollars. Leave at 0.00 if none.
Total sales (C\$)	Everything sold that day in córdobas.
Quantity of bales	How many bales were sold — the same number as on the paper sheet.
Number of invoices	How many invoices were written.

5.4 · C · Bank transfers — adding a payment

This is the most important section of the sheet. Every row here is a payment the shop says it put into a bank, and every row here is what the system will later try to find on the bank's statement.

C · Bank transfers
Add one row per deposit. A bank can appear as many times as needed in a day.

+ Add transfer

No transfers recorded for this day yet.

Total transfers (0 payments) \$ \$0.00 c\$ C\$0.00

Section C starts empty. Press **Add transfer** to create a row.

Adding one payment, step by step

- 1 Press **+ Add transfer** at the top right of section C. A blank row appears.
- 2 Choose the **Bank** the money went into — BAC, LAFISE, BANPRO or FICOHSA.
- 3 Choose the **Currency**: *USD \$* or *Córdoba C\$*. Get this right; it is the one thing the system will never overlook.
- 4 Type the **Amount**. Numbers only, with a dot for the decimals: `480.00` , not `C$480` .
- 5 Leave **Account** as "Any ... account" unless you know exactly which of that bank's accounts received it.
- 6 Put the deposit slip number in **Reference** if you have one. It is optional — but see the tip below.

C · Bank transfers
Add one row per deposit. A bank can appear as many times as needed in a day.

+ Add transfer

BANK	CURRENCY	AMOUNT	ACCOUNT	REFERENCE
BAC	USD \$	480.00	Any USD account	DEP-4471

Press **Enter** in the amount box to start another row. It keeps the same bank and currency.

Total transfers (1 payment) \$ \$480.00 c\$ C\$0.00

One payment: \$480.00 into BAC, with a deposit slip number.

Adding several payments — the quick way

Most days a shop banks into the same place more than once, so the form is built for that. After you type an amount, press **Enter**: a new row appears, already set to the same bank and currency, with the cursor waiting in its amount box.

Three deposits into LAFISE in córdobas is therefore:

- 1 Press **+ Add transfer** once. The cursor lands in the amount box.
- 2 Choose the bank and currency for the first one.
- 3 Type `8275` — Enter — `8350` — Enter — `2000` .

Your hands never leave the keyboard, and the bank and currency are chosen once rather than three times. If a deposit went somewhere else, just change that row's bank; the next row will then follow the new one.

C • Bank transfers + Add transfer

Add one row per deposit. A bank can appear as many times as needed in a day.

BANK	CURRENCY	AMOUNT	ACCOUNT	REFERENCE
LAFISE	Cordoba C\$	8275.00	Any NIO account	Deposit slip no.
LAFISE	Cordoba C\$	8350	Any NIO account	Deposit slip no.
LAFISE	Cordoba C\$	0	Any NIO account	Deposit slip no.

Needs to be more than zero

Press **Enter** in the amount box to start another row. It keeps the same bank and currency.

Total transfers (3 payments) \$ \$0.00 C\$ C\$16,625.00

Three rows entered without touching the mouse. The count beside the totals — **3 payments** — is there to check against the number of deposit slips in your hand.

Type the amount however it is written

The amount box accepts what is printed on the slip. **C\$8,275.00** , **\$480** , **8 275,00** — all are understood and tidied to a plain number when you leave the box. You do not have to strip the symbols yourself.

A ZERO OR A BLANK IS REFUSED STRAIGHT AWAY

A row whose amount is not above zero turns red as you type, rather than waiting until you press Save. Either give it an amount or remove the row with the bin icon.

C • Bank transfers + Add transfer

Add one row per deposit. A bank can appear as many times as needed in a day.

BANK	CURRENCY	AMOUNT	ACCOUNT	REFERENCE
BAC	USD \$	480.00	Any USD account	DEP-4471
BAC	Cordoba C\$	8275.00	Any NIO account	Deposit slip no.
LAFISE	Cordoba C\$	8350.00	Any NIO account	Deposit slip no.

Press **Enter** in the amount box to start another row. It keeps the same bank and currency.

Total transfers (3 payments) \$ \$480.00 C\$ C\$16,625.00

Three payments on one day: two into BAC (one in each currency) and one into LAFISE. The totals underneath add up each currency separately — **\$480.00** and **C\$16,625.00** — and never into a single number.

A BANK MAY APPEAR MORE THAN ONCE IN A DAY

If the shop made three separate deposits into BAC, enter three rows — not one row with the total. The bank statement will show three separate lines, and the system matches line for line. Combining them into one row is the most common reason a payment ends up **unmatched** .

WORTH THE EXTRA SECONDS

Filling in the **Reference** makes matching noticeably more certain. When two deposits of the same amount happen on the same day, the reference is often the only thing that tells them apart — and without it the system will stop and ask a person to choose.

Removing a payment

The red bin icon at the end of a row removes it. If the row was already saved and had been matched to a bank line, removing it also releases that bank line so it can be matched to something else. The removal is recorded in the audit log.

What a saved sheet looks like

C • Bank transfers

+ Add transfer

Add one row per deposit. A bank can appear as many times as needed in a day.

BANK	CURRENCY	AMOUNT	ACCOUNT	REFERENCE	
BAC	Cordoba C\$	4452.00	Any NIO account	Deposit slip no.	Matched
LAFISE	Cordoba C\$	14098.00	Any NIO account	Deposit slip no.	Matched
LAFISE	USD \$	410.00	Any USD account	Deposit slip no.	Matched
BAC	USD \$	250.00	Any USD account	Deposit slip no.	Possible

Press **Enter** in the amount box to start another row. It keeps the same bank and currency.

Review & save • Transfers \$660.00 / C\$18,550.00

CancelSave changes

Once saved, each payment carries its reconciliation status: **matched** , **possible** or **unmatched** . Matching runs automatically the moment you save — you do not have to ask for it.

5.5 · D · Expenses

D · Expenses

+ Add expense

CATEGORY	DESCRIPTION	CURRENCY	AMOUNT	
Transport	Delivery van fuel	USD \$	60.00	

Total expenses \$60.00 C\$0.00

Section D. One row per expense, each with its own currency.

Press **+ Add expense** for each item paid out of the day's cash. *Category* is free text — use the same words each time (Transport, Wages, Rent) and the reports will group usefully. Expenses reduce the closing balance; see §5.9.

5.6 · E · Bales and balances

E · Bales and balances

BALE TYPE	OPENING	RECEIVED	SOLD	CLOSING

Starting balance + sales – expenses – amounts deposited to banks. The exact components are configurable in Settings, and the saved sheet shows the calculation step by step.

review & save · Transfers \$480.00 / C\$16,625.00

Cancel

Create sheet

Section E holds the bale counts and the money figures that are not sales: starting balance, delivery, commercial invoice and credit.

The bale table

One row per bale type — 100 lb and 25 lb are set up already. Fill in opening, received, sold and closing quantities. If your business adds another bale size later, an administrator creates it in Settings and a new row appears here automatically.

The money fields

FIELD	WHAT IT MEANS
Starting balance	The cash in hand at the start of the day, per currency.
Delivery	The delivery figure from the paper sheet.
Commercial invoice	The commercial invoice figure from the paper sheet.
Credit	Goods given on credit and not yet paid for.

Whether delivery, commercial invoice and credit affect the closing balance is a setting, not a fixed rule — see §13.5. Out of the box they are recorded but not subtracted.

5.7 · F · Observations

F · Observations

Anything unusual about this day...

Anything unusual about the day.

Free text. Worth using whenever something will need explaining later: a deposit made after the bank closed, a customer paying the company directly, a till discrepancy. When a payment turns up unmatched three weeks on, this note is often the fastest answer.

5.8 · Saving, editing and locking

Review & save · Transfers \$480.00 / C\$16,625.00

Cancel

Create sheet

The bar at the foot of the screen follows you as you scroll, and shows the transfer totals so you can check them against the paper before saving.

Press **Create sheet** (or **Save changes** on an existing one). The system checks the figures, saves, and immediately runs matching against whatever bank data it already holds.

Editing later

Open the sheet from **Daily accounting** and change what you need. Every edit is recorded in the audit log with the old and new values, so the history of a figure is always recoverable.

Locking

An administrator can **Lock** a sheet once a period is closed. A locked sheet cannot be edited by anyone except an administrator, who must unlock it first. Use this at month end.

Archiving

Archive removes a sheet from lists, dashboards and reports — but nothing is deleted. The record, its payments and any reconciliation history stay in the database and in the audit log. After archiving, the same shop and date can be used again.

5.9 · The closing balance, explained

You do not have to work the closing balance out. The system does it and, more importantly, shows you exactly how — line by line, so it can be checked against the paper sheet.

Closing balance, step by step

Exactly how the figure was reached, so it can be checked against the paper sheet.

US DOLLARS

+ Starting balance	\$300.00
+ Total sales	\$1,310.00
– Total expenses	\$60.00
– Deposited to banks	\$660.00
Closing balance	\$890.00

CORDOBAS

+ Starting balance	C\$5,000.00
+ Total sales	C\$31,840.00
– Total expenses	C\$1,200.00
– Deposited to banks	C\$18,550.00
Closing balance	C\$17,090.00

Shown at the top of every saved sheet. Each currency is worked out on its own.

The default calculation is:

$$\text{Starting balance} + \text{Total sales} - \text{Total expenses} - \text{Deposited to banks} = \text{Closing balance}$$

Which components are included, and whether each adds or subtracts, is configurable (§13.5). Whatever you configure is what the breakdown above will show.

Entering the closing balance by hand

Tick *Enter the closing balance by hand* in section E if you need to record the counted figure rather than the calculated one. The system then shows both, and the difference between them, rather than hiding the disagreement:

A DIFFERENCE IS INFORMATION, NOT AN ERROR

If the counted cash and the calculated figure disagree, that gap is exactly what you want to see — it usually means an expense or a deposit has not been entered. The system will keep showing it until the sheet is corrected.

6 · Uploading bank statements

The other half of reconciliation. Administrators and accountants upload the PDF each bank produces; the system reads the transactions out of it.

Reconcilia
Shop accounting & banking

Bank statements
Upload a statement PDF; the transactions are extracted and matched automatically.

Password Sign out

Every statement uploaded, newest first, with what was read out of it.

6.1 How to upload one

- 1 Open **Bank statements** and press **Upload statement**.
- 2 Choose the **bank account** the statement belongs to. Each bank has one account per currency — pick the matching one.
- 3 Optionally set the period the statement covers. The system reads the dates out of the file anyway; this is only for your own filtering.
- 4 Choose the **PDF file** and press **Upload**.

Upload a bank statement [X]

BANK ACCOUNT
Choose the account this statement belongs to... [v]

PERIOD START (OPTIONAL) [mm/dd/yyyy] [calendar icon] PERIOD END (OPTIONAL) [mm/dd/yyyy] [calendar icon]

PDF FILE
Choose File No file chosen

PDF only, up to 25 MB. Uploading the same file twice for one account is refused.

[Cancel] [Upload]

The upload dialog. If the chosen bank has no parser yet, it warns you here rather than after the fact.

CHOOSE THE RIGHT CURRENCY ACCOUNT

If you upload a córdoba statement to a dollar account, the system detects the mismatch from inside the file and refuses it with an explanation. It will not import the figures as the wrong currency.

6.2 What happens next

Processing runs in the background, so you can carry on working. The list refreshes itself while a statement is being read. It ends in one of these states:

STATUS	MEANING
Uploaded	Stored, waiting to be read.
Processing	Being read now. A scanned statement takes longer, because it goes through text recognition.
Processed	Read completely. Every line was extracted.
Partially processed	Most of it was read, but something could not be. The reason is shown, and the lines it could not read are quoted so you can enter them another way.
Failed	Nothing could be read. The message says why — wrong currency, unknown format, or a bank with no parser yet.

6.3 Checking what was extracted

Click any statement to see the transactions read out of it.

A BAC statement after processing. The *Parser* file shows which bank format was used and whether the file had readable text or needed character recognition.

Open the statement and compare the extracted rows against the paper or the original PDF. If the extraction is right, everything downstream will be. It takes two minutes and only needs doing once per bank format.

BAC's statements contain no readable text at all — they are produced by "Print to PDF" and the characters are drawn as shapes. The system reads them by recognising the characters in the image, then checks every amount against the statement's own running balance column. A row the balance confirms is trusted; a row it cannot confirm is marked **OCR 80%** so you can check it by eye.

Uploading the same file twice for one account is refused outright. Uploading a statement whose period overlaps one already loaded is fine: lines already known are counted as duplicates and not added twice, and only genuinely new lines come in.

BANK TRANSACTION

Not found

No bank transaction in the allowed window has this amount, currency and bank.

Find it manually Ignore

No bank line in the allowed window has this amount, currency and bank.

7 · Reconciliation (continued)

7.2 Confirming a possible match

Read the candidates, then press **Match #1** or **Match #2** beside the right one. The others are discarded and become available for other payments. The choice is recorded in the audit log with your name.

If none of them is right, leave it. Use **Ignore** only if you are sure there will never be a bank counterpart.

7.3 Matching by hand

On an unmatched payment, press **Find it manually**. You get every transaction in the same currency near that date, including ones the automatic rules rejected.

Find the bank transaction for \$999.00

Shop 1 → BAC \$999.00 on 20 Aug 2026

REASON (RECORDED IN THE AUDIT LOG)
e.g. the bank posted it the next working day

Only USD transactions are listed. A payment in one currency can never be the same money as a payment in another, so the list will not offer them.

DATE	BANK	DESCRIPTION	REFERENCE	DEBIT	CREDIT	CURRENCY	STATUS
20 Aug 2026	BANPRO	Nc-Depósito En Agente Banpro[-000]Ref...	48229939	—	200.00	\$	Unmatched
20 Aug 2026	BANPRO	Dep: Azucena Fonseca	—	—	245.00	\$	Unmatched
20 Aug 2026	LAFISE	Eddy Espinoza	25338514	—	15.00	\$	Unmatched
20 Aug 2026	LAFISE	Transferencia entre cuentas	145051036	—	10.00	\$	Unmatched

The manual picker. Add a reason — it goes into the audit log and explains the decision to whoever reads it later.

Two things it will still refuse, even by hand:

- A transaction in a **different currency**. Those can never be the same money, so they are not even listed.
- A transaction that is **already reconciled** to another payment. Unmatch that one first.

7.4 Undoing a match

Press **Unmatch** on a matched payment, give a reason, and confirm. Both sides become available again.

NOTHING IS LOST WHEN YOU UNMATCH

The old match is kept and appears under *Previous matches* on that payment, with who undid it and why. The history of a reconciliation is always reconstructable.

7.5 Ignoring a line

Some bank lines will never have a shop payment behind them — interest, bank charges, a transfer between the company's own accounts, a customer paying head office directly. Marking one **Ignored** takes it out of the

exception list without pretending it was matched. The same is available for a shop payment that will never appear at the bank.

7.6 Why it refuses to guess

Three things are absolute requirements for any match:

Currency	Must be identical. Always.
Bank	Must be identical — and the account too, if the sheet named one.
Amount	Must be identical, unless an administrator has set a tolerance.

Only the **date** is allowed to be approximate, because a deposit made late in the day may land on the next banking day. The window is three days by default.

Within those limits the system scores each candidate, and matches on its own only when one candidate is clearly best. When two are equally good it stops. That is not indecision — two identical deposits on one day are perfectly ordinary, and picking one at random would reconcile the wrong money and leave no trace of the mistake.

8 · Unmatched — the exceptions

Two lists that answer the question the business actually cares about: what is missing, in each direction.

Shop payments the bank has no record of, above; bank receipts no shop claimed, below. Each list totals separately per currency.

Shop payments not found in the bank

The shop says it banked this and the bank does not show it. Usually one of:

- The statement for that day has not been uploaded yet. *Check first.*
- The amount was typed wrongly on the sheet.
- Several deposits were entered as one combined row.
- The deposit was made after the bank's cut-off and lands outside the date window.
- The money never actually reached the bank. **This is the one that matters.**

Bank receipts with no shop record

Money arrived that no shop claimed. Usually one of:

- A customer paid the company directly.
- A transfer between the company's own accounts.
- Bank interest or a reversal.
- A shop banked money and forgot to record it on the sheet.

WORK THIS PAGE, NOT THE RECONCILIATION PAGE

Matched payments need no attention. Open **Unmatched** each morning, deal with what is on it, and the reconciliation looks after itself. An empty page means the day is fully accounted for.

9 · Transactions

Every line extracted from every statement, in one searchable list. Use it when you need to answer "did this exact payment ever arrive?"

Choose a report, set the filters, read it on screen, then export.

Export Excel gives a formatted workbook with the money columns as real numbers you can total. **Export PDF** gives a printable document. Both carry the filters you applied, printed at the top, so a report can never be mistaken for covering a different period. Exports are recorded in the audit log.

REPORT	WHAT IT ANSWERS
Daily accounting	One row per shop per day: sales, deposits, expenses, closing balance.
Monthly accounting	The same rolled up by month and shop.
Shop sales	Totals per shop for the period.
Bank transactions	Every extracted bank line.
Matched transactions	Payments confirmed against a bank line, with the day gap and confidence.
Unmatched transactions	Both exception lists in one document. The one to send to management.
Possible matches	Everything waiting for a person to decide.
USD transactions	Dollar movements only.
Córdoba transactions	Córdoba movements only.
Reconciliation summary	How much of each shop's banking is accounted for, by bank and currency, with a percentage.

11 · The dashboard

Administrators and accountants only. A shop user asking for this page is refused.

The four tiles across the top answer four questions for the chosen period:

- **Sales recorded** — what the shops say they sold.
- **Banked by shops** — what the shops say they deposited.
- **Received by banks** — what the statements actually show arriving.
- **Reconciliation** — how those two agree, split into matched, possible and unmatched, with amounts.

The gap between *Banked by shops* and *Received by banks* is worth a glance every day. They will rarely be identical — the banks receive money from other sources too — but a large or growing gap in the wrong direction is the first sign of a problem.

Below, sales per day are charted per currency, and the tables break the period down by shop and by bank. Everything respects the date range and shop filter at the top.

Every sign-in, financial edit and reconciliation decision.

Each entry records who, what, when, from which address — and, where a figure changed, its value before and after. Expand **What changed** to see them side by side.

Filter by action, module, date or free text. Some entries worth knowing: `EDIT_ACCOUNTING` (a figure on a sheet was changed), `MANUAL_MATCH` (someone matched by hand), `UNMATCH_TRANSACTION` (a match was undone), `LOGIN_FAILED` (a sign-in attempt failed).

THIS IS THE RECORD THAT PROTECTS EVERYONE

Because every change is attributed and reversible, a mistake can be traced and corrected rather than argued about. That only works if each person has their own account.

Users & roles

Matching rules

System

Shops

New shops can be added at any time; nothing in the system assumes there are three.

+ Add shop

CODE	NAME	CITY	STATUS	
SHOP1	Shop 1	Managua	Active	Deactivate
SHOP2	Shop 2	Leon	Active	Deactivate
SHOP3	Shop 3	Granada	Active	Deactivate

Cities

Granada

Nicaragua

Leon

Nicaragua

Managua

Nicaragua

New city

Add

Nothing in the system assumes there are three shops. Add a fourth whenever you need one.

Add shop needs a short code (`SHOP4`), a name and a city. *Deactivate* hides a shop from new entries while keeping all its history and reports intact — use it instead of deleting when a shop closes.

13.2 Banks and accounts

Reconcilia
Shop accounting & banking

Settings
Reference data, users and how matching behaves.

Shops & cities **Banks & accounts** Users & roles Matching rules System

BAC — BAC Credomatic
Statements are read by the BAC parser.

ACCOUNT	NUMBER	CURRENCY	STATUS
BAC Cordobas	370555179	NIO	Active
BAC Dollars	370555203	USD	Active

BANPRO — Banco de la Produccion
Statements are read by the BANPRO parser.

ACCOUNT	NUMBER	CURRENCY	STATUS
BANPRO Cordobas	BANPRO-NIO-01	NIO	Active
BANPRO Dollars	BANPRO-USD-01	USD	Active

FICOHSA — FICOHSA
No statement parser is available for this bank yet. Uploads are stored and reported honestly rather than guessed at.

ACCOUNT	NUMBER	CURRENCY	STATUS
FICOHSA Cordobas	FICOHSA-NIO-01	NIO	Active
FICOHSA Dollars	FICOHSA-USD-01	USD	Active

LAFISE — Banco LAFISE Bancentro
Statements are read by the LAFISE parser.

ACCOUNT	NUMBER	CURRENCY	STATUS
LAFISE Cordobas	LAFISE-NIO-01	NIO	Active

Each bank, its accounts, and whether a statement parser exists for it.

Each bank needs **one account per currency**, with the real account number. The *parser* is the piece of software that reads that bank's statement layout; leave it on "detect automatically" unless told otherwise.

AN ACCOUNT'S CURRENCY CANNOT BE CHANGED LATER

Once transactions exist on an account, its currency is fixed. Changing it would silently corrupt every total and every match made against it. Create a new account instead.

13.3 Users and roles

The screenshot shows the 'Settings' page for 'Reconcilia', specifically the 'Users & roles' tab. The left sidebar contains navigation links: Dashboard, Daily accounting, Bank statements, Transactions, Reconciliation, Unmatched, Reports, Audit log, and Settings (highlighted). The main content area is titled 'Settings' with the subtitle 'Reference data, users and how matching behaves.' Below this are tabs for 'Shops & cities', 'Banks & accounts', 'Users & roles' (selected), 'Matching rules', and 'System'.

The 'Users' section features a table with columns: NAME, EMAIL, ROLE, SHOPS, and STATUS. There is an '+ Add user' button in the top right. The table lists four users: Shop 1 user, Shop 2 user, Shop 3 user, and System administrator. Each user has a 'Deactivate' button. The 'Status' column shows 'Active' for all users.

The 'Roles' section has the subtitle 'Permissions are data, so new roles can be added without a code change.' It lists three roles: Administrator (ADMIN), Accountant (ACCOUNTANT), and Shop user (SHOP_USER). Each role has an 'Edit permissions' button. The Administrator role has 21 permissions and 1 user. The Accountant role has 13 permissions and 0 users. The Shop user role has 6 permissions and 3 users.

At the bottom left, there is a 'System administrator' section with a gear icon and buttons for 'Password' and 'Sign out'.

NAME	EMAIL	ROLE	SHOPS	STATUS
Shop 1 user	shop1@reconcilia.local	Shop user	SHOP1	Active
Shop 2 user	shop2@reconcilia.local	Shop user	SHOP2	Active
Shop 3 user	shop3@reconcilia.local	Shop user	SHOP3	Active
System administrator	admin@reconcilia.local	Administrator	All (role-wide)	Active

Role	Permissions	Users
Administrator (ADMIN)	Full access to every shop, bank and setting.	21 permission(s) · 1 user(s)
Accountant (ACCOUNTANT)	Works across all shops and banks but cannot manage users.	13 permission(s) · 0 user(s)
Shop user (SHOP_USER)	Enters the daily sheet for their assigned shops only.	6 permission(s) · 3 user(s)

Users above, roles below.

Add user takes a name, an email, a password of at least ten characters, a role, and the shops that user may work with. Roles that include dashboard access see every shop regardless of the ticks.

Edit permissions on a role shows every permission in the system with a plain-English description. You can also create entirely new roles — a stock-taker who may only read, for instance. The system stops you removing user management from your own role, because that would lock you out.

Use *Deactivate* rather than deletion when someone leaves: their name stays attached to everything they did in the audit log.

Reference data, users and how matching behaves.

Shops & citiesBanks & accountsUsers & rolesMatching rulesSystem

Matching rules

Currency and bank are always required. Only the date window and the score thresholds are adjustable.

DATE WINDOW (DAYS)

3

How many days a bank transaction may differ from the sheet date.

AMOUNT TOLERANCE

0.00

Leave at 0.00 to require the amount to match exactly.

AUTOMATIC MATCH AT OR ABOVE

95

SUGGEST AT OR ABOVE

60

☒ Never match automatically when more than one transaction is equally good

Strongly recommended. Two identical deposits on one day are ordinary; picking one at random would reconcile the wrong money.

☐ Also consider outgoing transactions

Off by default: shop payments are money coming in.

Save

The only parts of matching that are adjustable. Currency and bank are never negotiable.

SETTING	WHAT IT DOES
Date window	How many days a bank line may differ from the sheet date. Three is sensible; raising it finds more matches but makes wrong ones likelier.
Amount tolerance	Leave at 0.00 so amounts must be exact. Raise it only if a bank deducts a fixed fee.
Automatic match at or above	The score needed to match without asking. 95 means exact amount, same bank, same date.
Suggest at or above	The score below which nothing is offered at all.
Never match automatically when more than one is equally good	Leave this on. It is what stops the wrong money being reconciled.
Also consider outgoing transactions	Off by default — shop payments are money coming in.

☐ Commercial invoice

commercial_invoice

Not used

Every saved sheet shows the calculation step by step using exactly these components.

Save

Which parts of the sheet feed the closing balance, and whether each adds or subtracts.

This is where the arithmetic of the closing balance is defined. Tick a component to include it and choose whether it adds or subtracts. Whatever you set here is exactly what the step-by-step breakdown on each sheet will show — the two can never disagree.

14 · Using it on a phone

Everything works on a phone. The sidebar becomes a menu behind the ☰ button, tables become cards, and the daily sheet stacks into one column. Uploading a statement PDF from a phone works too.

The menu

Entering a sheet

Reconciliation

15 · A daily and monthly routine

Each shop, at the end of the day

- 1 Open **Daily accounting** → **New sheet**.
- 2 Enter the day's figures from the paper sheet.
- 3 Add one row in section C for every *separate deposit*, with its reference.
- 4 Check the transfer totals in the bottom bar against the paper.
- 5 Set the status to *Submitted* and save.

The office, each morning

- 1 Upload yesterday's statement from each bank and currency.
- 2 Open the newest statement and check the extracted rows look right.
- 3 Open **Reconciliation**, filter to *Possible*, and decide each one.
- 4 Open **Unmatched** and work through both lists.

- 5 Glance at the dashboard: banked by shops against received by banks.

Month end

- 1 Make sure every statement for the month has been uploaded.
- 2 Press **Run matching** over the whole month.
- 3 Clear the **Unmatched** page as far as it can be cleared, ignoring what genuinely has no counterpart.
- 4 Export the *Reconciliation summary* and *Unmatched transactions* reports.
- 5 Lock the month's sheets.
- 6 Run `./backup.sh` on the server and copy the result somewhere else.

16 · Keeping the system up to date

The code lives in a private GitHub repository. Changes are checked automatically; putting them on the live server is a button somebody presses.

What happens when the code changes

Every push runs four checks: the whole backend test suite against a real PostgreSQL, the frontend type check, lint and build, the Docker configuration, and every shell script. A red tick means the change is not safe to ship, and the deploy will refuse to run.

Putting a change live

- 1 Open the repository on GitHub and go to **Actions**.
- 2 Choose **Deploy** in the left-hand list.
- 3 Press **Run workflow**, type `deploy` in the confirmation box, and run it.

It re-runs every test, copies the code to the server, rebuilds, restarts, and then checks the API answers before calling itself finished. If the site does not come back healthy, the run fails loudly rather than leaving you to discover it.

A DEPLOYMENT NEVER TOUCHES YOUR RECORDS

The database lives in a Docker volume that is not part of the copy, and the settings file, the uploaded statement PDFs and the sample statements are all excluded. Deploying replaces the program, not the data.

Deploying by hand instead

Everything still works from the server directly, which is useful if GitHub is unavailable:

<code>sudo ./server-setup.sh --update</code>	Rebuild and restart with the code currently on the server.
<code>docker compose logs -f api worker</code>	Watch what is happening.
<code>./backup.sh</code>	Dump the database and the stored statements.

THE REPOSITORY MUST STAY PRIVATE

The real bank statements are deliberately excluded from it, but this manual — which is kept in the repository — is illustrated with screenshots showing real transaction descriptions and customer names. Making the repository public would publish those.

17 · When something looks wrong

WHAT YOU SEE	WHAT IT MEANS
"A record for this shop and date already exists"	Someone has already entered that day. Open the existing sheet instead of creating a second one.
"This transaction is already reconciled"	The bank line is matched to another payment. Find that payment, unmatch it, then try again.
"Currency mismatch"	You tried to match a dollar payment to a córdoba line. They cannot be the same money.
"This statement is for a USD account but you selected a NIO account"	Right file, wrong account. Choose the matching one and upload again.
"This exact file was already uploaded"	Harmless. Open the statement that already exists.
A payment stays unmatched although the money did arrive	Check the statement is uploaded; check the amount on the sheet; check several deposits were not combined into one row; then match it by hand.
A payment shows possible with two identical candidates	Working as intended. Read the descriptions and references and choose.
A row is flagged OCR 80%	Read by character recognition and not confirmed by the statement's running balance. Check that one row against the PDF.
The dashboard shows nothing	Almost always the date range. It defaults to the last thirty days.
"Your role does not allow this action"	You are signed in as a shop user. Ask an administrator.

18 · Words used in this manual

Daily sheet	One shop's record of one day. The digital version of the paper sheet.
Transfer / payment	One deposit the shop made into a bank, recorded in section C of a sheet.
Transaction	One line read out of a bank statement.
Match	The link between a payment and the transaction that is the same money.
Statement	A PDF from a bank, and everything read out of it.
Parser	The part of the software that understands one particular bank's layout.
OCR	Reading characters out of an image, used where a PDF has no readable text.
Confidence	How strongly the evidence supports a match, out of 100. The reasoning is always shown.
Ignored	Deliberately excluded from the exception lists because it will never have a counterpart.
Archived	Hidden from lists and reports, but kept in full in the database and audit log.
Locked	A sheet closed against editing. Only an administrator can unlock it.

Reconcilia user manual, version 1.0. Screenshots are of the running system with demonstration data. Figures shown are examples, not real trading records.
